

Installing CUPS server

To install the server the cupsd package and dependencies need to be downloaded.

```
dnf install cups -y
```

After installation only a couple of items need to be changed under

```
/etc/cups/cupsd.conf
```

Find Listen 127.0.0.1:631 and replace with

```
Listen *:631
```

Confirm the following is enabled

```
Browsing On  
BrowseLocalProtocols dnssd
```

Edit these two sections as follows

```
# Restrict access to the server...  
<Location />  
  Order allow,deny  
  Allow @LOCAL  
</Location>  
  
# Restrict access to the admin pages...  
<Location /admin>  
  AuthType Default  
  Require valid-user  
  Order allow,deny  
  Allow @LOCAL  
</Location>
```

This line can be added near the top if a 400 bad request is happening due to DNS problems or the gold image that is being used.

```
ServerAlias *
```

Save. Now add the firewall rules

```
firewall-cmd --add-port=631/tcp --permanent  
firewall-cmd --reload
```

Restart cups

```
systemctl restart cups
```
